Reconcillations reports API

RapidoReach Publisher API Guide

Reconcialation Report API

Method: GET

```
URL:
http://www.rapidoreach.com/api/v1/reconciliations/{{publisher_id}}/{{app_id}}?key={{app_api_key}}&limit=3&skip=2
```

Params

`publisher_id: Publisher User id` `app_id: App id`

Query

`app_api_key`: API Key generated for an app. It can be found on publisher portal

`limit`: it is a number of records to fetch in one query request. It is limited to maximum 500 records for performance reasons

`skip`: Number of records to be skipped.

For example there are total 350 records are available. You can then fetch it as follows

```
set skip = 0 and limit = 100 -> it will show first 100 records
set skip = 100 and limit 100 -> to get another set of 100 records
set skip = 200 and limit 100 -> to get another set of 100 records
```

```
set skip = 300 and limit 100 -> to get another set of 50 records
```

At this point records retrieved (50) are less than requested (limit = 100) hence there are no more records are available to fetch

Records the total number of records retrived it skip (300) + final call records (50) = 350 in total

Store this number in your system

Next time start from this number and retrieve from 350 ie skip = 350

set skip = 350 and limit 100 and so on
